

# Water Availability and Traditional Knowledge based Adaptation to Climate Change

**Pradip Dey**

[pradipdey@yahoo.com](mailto:pradipdey@yahoo.com)

**I ISS, Bhopal**

# Climate change

- Climate change is a defining moment of our time with major negative implications on ecology, human culture, livelihoods and food security.
- The IPCC advocates to search local solutions for climate change adaptations; however, its report does not recognize the breadth and strength of century tested traditional knowledge in combating climate change.

## Fresh Water Resources – 2.7 %

# Global Water Availability

## Water: Major concerns

- Most critical resource for Indian agriculture
- The resource is shrinking
- Increased competition from other sectors
- Decline in water table
- Water-logging and salinity
- Increased pollution
- Environmental change to affect availability
- Reduction in river flow

## Decreasing per capita water availability in India

|                    |                       |
|--------------------|-----------------------|
| 1955               | - 5300 m <sup>3</sup> |
| 1990's             | - 2200 m <sup>3</sup> |
| World Average      | - 7400 m <sup>3</sup> |
| Asia Average       | - 3240 m <sup>3</sup> |
| Projected for 2025 | - 1465 m <sup>3</sup> |
| Projected for 2050 | - 1235 m <sup>3</sup> |

India: 2005 - 1731 cu. m  
 2007 - 1656 cu. m

Changes in Population and Per Capita Water Availability Over Time

# Per Capita Water Availability

# Basin-wise Per Capita Water Availability

# Per capita storage (cu.m.)

## Days of average flow (which reservoirs can store)

|               |         |
|---------------|---------|
| Colorado (US) | 850-900 |
|---------------|---------|

|                  |        |
|------------------|--------|
| Gray Darling (S) | 85-900 |
|------------------|--------|

|                    |     |
|--------------------|-----|
| Orange (S. Africa) | 500 |
|--------------------|-----|

|       |     |
|-------|-----|

|------|----------|

## Indian farmer is diversifying

**This diversification is occurring outside Command areas (IFPRI).**

**Diversification requires year-round, on-demand irrigation.**

**Value added farming**

## Annual Requirement of Freshwater (Billion Cubic Meters - BCM)

| User Sector   | 2008-09 | 2025 | 2050 | Ratio |
|---------------|---------|------|------|-------|
| Irrigation    | 501     | 910  | 1072 | 2.1   |
| Domestic      | 30      | 73   | 102  | 3.4   |
| Industries    | 20      | 22   | 63   | 3.1   |
| Thermal Power | 20      | 15   | 130  | 6.5   |
| Others        | 24      | 72   | 80   | 3.3   |
| Total         | 605     | 1092 | 1447 | 2.4   |

## Status of groundwater level in Delhi

## Water Resources and Liabilities in India

|                           |              |
|---------------------------|--------------|
| Fresh Water Resources     | 4 % (1/25)   |
| and                       | 2.3 % (1/44) |
| Population                | 17 % (1/6) ↑ |
| Livestock                 | 11 % (1/9)   |
| Rainfall                  | 117 cm       |
| ~ Global Average – 110 cm |              |

# Global Water Cycle

Oceans contain about 98 %  
of the earth's water.

About 1.8 % is ice found  
in the two polar ice caps  
and mountain glaciers.

Only 0.5 % is in the water  
table and ground water.

The atmosphere contains  
only 0.001 % of the earth's  
water, but is the major  
driver of weather.

# Global Water Cycle

## THE GLOBAL WATER CYCLE

All values in  $10^{18}$  grams per year

Evaporation exceeds precipitation over the oceans; thus there is a net movement of water to the land.

Nearly 60% of the precipitation that falls on land is either evaporated or transpired by plants; the remainder is runoff and groundwater.

## Way-forward

The emerging scenario from different parts of the globe suggests that neither the scientific technologies alone nor the traditional knowledge exclusively can completely solve the threats of food and nutritional security challenges emanating from climate change--however, a fusion of the two can.

**Water dynamics in lowland rice soil**

## **Key Water Issues**

**Uneven fields**

**Flood irrigation**

**Low quality supply-driven irrigation systems**

**Rain water management**

**Puddling**

# **Solving the Water Crisis**

**Identification of input use efficient crop**  
**Integrated use of rain, surface and ground waters**  
**Judicious use of polluted and poor quality waters**  
**Development and transfer of cost effective and eco-friendly technologies**  
**Awareness among farmers about value and scarcity of water and negative fallouts of improper use**  
**Operation and maintenance charges**  
**Equitable distribution of water**  
**Participatory water management (WUA) – key**  
**Recharging the ground water aquifers**  
**Multiple uses of water – Enhancing income per unit quantity of water consumed**  
**Use of modern tools e.g. RS, GIS, DSS, Biotechnology**

# Improvement in surface water use

- On-farm irrigation hydraulics:
  - land leveling, methods, design
- Micro-irrigation systems:
  - Hardware components
  - Software components: Soil, Crop, ET
- Cropping pattern / diversification:
  - Rice to non-rice
- Drainage

## Improvement in groundwater use

- Recharge, water harvesting
- Adjusting the pumping rate
- Multiple well point
- Reuse of drainage water

# and preparation and rice transplanting

# Some New Techniques

# Water Saving Technologies

Laser land leveling -  
A Precursor technology

Raised bed  
planting

Irrigate when water is 15

# Development and Management Options

- **Evaluatory measures:** Assessment and monitoring
- **Corrective measures:** Artificial recharge, water harvesting, sub-surface drainage, conjunctive use
- **Protective measures:** Effluent treatment and safe disposal of pollutants
- **Regulatory and legislative measures:** Formulation of water resource development and use policy

# Traditional Knowledge

Traditional Knowledge can be defined as the collectively owned non-formal intellectual property comprised wisdom, knowledge and teaching developed by local and indigenous communities over time in response to the needs of their specific local environment and integral to the cultural or spiritual identity of the social group in which it operates, preserved and many-a-time orally transmitted for generations.

# Methodology

**Selection of tribes- Ho, Santhal,  
Munda, Oraon, and Lohra**

**Identification of the focus  
group - small scale farmers**

**Collection of primary data (through  
participatory approach) related to climate  
change adaptation and resilience  
strategies**

# **Traditional water management practices**

# Stone Bunding

- In this practice, bunds are constructed with locally available stones across the land slope.
- Effective for soil, water and nutrient conservation in undulating terrain especially in the

# **Stones-cum-Earthen Bunding**

- This practice involves constructing stone bunding at the base followed by earthen bunding on the top. Sometimes, in stone bunding, soil is filled in to work as a cementing agent.

## Stone-cum-Vegetative bunding

- In this practice, tribal farmers residing in forest villages make stone bunds in their fields and, to stabilize these bunds, they plant some trees and sometimes hardy bushes on the bunds.
- This is done with the help of local tools and very little maintenance

# Brushwood Waste Weir

- These weirs have been developed and used by the farmers for the last 10 - 15 years.
- Large runoff generated from such aberrations of rainfall due to changing climate can be effectively addressed .

# Established Grassed Waterways

These grassed waterways provide safe guard against soil erosion by diverting excess runoff through them.

# SPUR Structure

SPURs (temporary barrier like structures) are constructed after rice transplanting with the help of locally available materials like forest woods in locations where there is runoff

## Conclusion and policy implication

The study conclusively proved that planners and policy makers have yet another tool and dimension to initiate participatory action plan involving tribal farmers and their rich reserve of traditional knowledge in order to develop adoptable technology that will enable mitigation of water scarcity and problem of climate change for financial inclusion and mainstreaming of indigenous population

## Conclusion and policy implication

Indigenous people and their knowledge are central to the adaptive changes using available natural resources essential to face the world's changing climate.

Policies should also be adopted to transform the indigenous populations to precious partaker in vigilance and enforcement enterprise with authorized establishment in order to provide a strong foundation for solving water scarcity, combating climate change and ensuring

# Conclusion and policy implication

Moreover, region-specific amalgamated technological prescriptions refined with targeted policy analysis are required for effective implementation and obtaining positive outcomes within a finite time horizon.

THANK YOU
